Spec is the default UI building framework for Pharo. With Spec developers focus on presenter interaction and layout. Presenters are responsible for **defining** and **controling** the interaction of their sub-elements as well as domain objects.

With Spec, existing presenters or even complete UI's are **reused** and **configured** to form a new UI.

This book shows the basics of Spec in Pharo 12 and how it enables reuse of UIs. It focuses on Spec 2.0 features such as new widget layouts, dynamic widget building and more advanced features such as transmissions or commands.

A tutorial gets you started in less than 20 minutes.
